WO 2006/028545 A2

SUBSTITUTED IMIDAZOQUINOLINES, IMIDAZOPYRIDINES, AND  
IMIDAZONAPHTHYRIDINES

RELATED APPLICATION

The present invention claims priority to U.S. Provisional Application Serial No. 60/581274, filed June 18, 2004, which is incorporated herein by reference.

BACKGROUND

In the 1950's the 1*H*-imidazo[4,5-*c*]quinoline ring system was developed and 1-(6-methoxy-8-quinoliny)-2-methyl-1*H*-imidazo[4,5-*c*]quinoline was synthesized for possible use as an antimalarial agent. Subsequently, syntheses of various substituted 1*H*-imidazo[4,5-*c*] quinolines were reported. For example, 1-[2-(4-piperidyl)ethyl]-1*H*-imidazo[4,5-*c*]quinoline was synthesized as a possible anticonvulsant and cardiovascular agent. Also, several 2-oxoimidazo[4,5-*c*]quinolines have been reported.

Certain 1*H*-imidazo[4,5-*c*]quinolin-4-amines and 1- and 2-substituted derivatives thereof were later found to be useful as antiviral agents, bronchodilators and immunomodulators. Subsequently, certain substituted 1*H*-imidazo[4,5-*c*] pyridin-4-amine, quinolin-4-amine, tetrahydroquinolin-4-amine, naphthyridin-4-amine, and tetrahydronaphthyridin-4-amine compounds as well as certain analogous thiazolo and oxazolo compounds were synthesized and found to be useful as immune response modifiers, rendering them useful in the treatment of a variety of disorders.

There continues to be interest in the imidazoquinoline ring system, as well as other imidazo ring systems, and there is a continuing need for compounds that have the ability to modulate the immune response, by induction of cytokine biosynthesis or other mechanisms.

## SUMMARY

The present invention provides a new class of compounds that are useful in inducing cytokine biosynthesis in animals. Such compounds are of the following Formula (I):

I

wherein  $R_A$ ,  $R_B$ ,  $R_2$ ,  $R'$ ,  $Z$ , and  $m$  are as defined below.

Compounds of Formula (I) include imidazo-quinoline, -pyridine, and -naphthyridine ring systems, particularly quinolines, tetrahydroquinolines, pyridines, 1,5-naphthyridines, and 1,5-tetrahydronaphthyridines, substituted at the 1-position with a cyclic substituent.

The compounds of Formula I are useful as immune response modifiers due to their ability to induce cytokine biosynthesis (e.g., induces the synthesis of at least one cytokine) and otherwise modulate the immune response when administered to animals. This makes the compounds useful in the treatment of a variety of conditions such as viral diseases and tumors that are responsive to such changes in the immune response.

The invention further provides pharmaceutical compositions containing an effective amount of a compound of Formula I and methods of inducing cytokine biosynthesis in an animal, treating a viral infection and/or treating a neoplastic disease in an animal by administering an effective amount of a compound of Formula I to the animal.

In addition, methods of synthesizing compounds of Formula I useful in the synthesis of these compounds are provided.

As used herein, "a," "an," "the," "at least one," and "one or more" are used interchangeably.

The terms "comprises" and variations thereof do not have a limiting meaning where these terms appear in the description and claims.

5 The above summary of the present invention is not intended to describe each disclosed embodiment or every implementation of the present invention. The description that follows more particularly exemplifies illustrative embodiments. In several places throughout the application, guidance is provided through lists of examples, which  
 10 examples can be used in various combinations. In each instance, the recited list serves only as a representative group and should not be interpreted as an exclusive list.

10           When "heterocyclyl" contains a nitrogen atom, the point of attachment of the heterocyclyl group may be the nitrogen atom.

          The terms "arylene," "heteroarylene," and "heterocyclylene" are the divalent forms of the "aryl," "heteroaryl," and "heterocyclyl" groups defined above. Likewise, "arylenyl," "heteroarylenyl," and "heterocyclenyl" are the divalent forms of the "aryl," "heteroaryl," and "heterocyclyl" groups defined above. For example, an alkylarylenyl group comprises an arylene moiety to which an alkyl group is attached.

          The term "fused aryl ring" includes fused carbocyclic aromatic rings or ring systems. Examples of fused aryl rings include benzo, naphtho, fluoreno, and indeno.

20           The term "fused heteroaryl ring" includes the fused forms of 5 or 6 membered aromatic rings that contain one heteroatom selected from S and N.

          The term "fused 5 to 7 membered saturated ring" includes rings which are fully saturated except for the bond where the ring is fused.

25           When a group (or substituent or variable) is present more than once in any Formula described herein, each group (or substituent or variable) is independently selected, whether explicitly stated or not. For example, for the formula -N(R<sub>9</sub>)<sub>2</sub> each R<sub>9</sub> group is independently selected. In another example, when an R' and an A' group both contain an R<sub>4</sub> group, each R<sub>4</sub> group is independently selected.

30           The invention is inclusive of the compounds described herein in any of their pharmaceutically acceptable forms, including isomers (e.g., diastereomers and enantiomers), salts, solvates, polymorphs, prodrugs, and the like. In particular, if a compound is optically active, the invention specifically includes each of the compound's enantiomers as well as racemic mixtures of the enantiomers. It should be understood that

the term "compound" includes any or all of such forms, whether explicitly stated or not (although at times, "salts" are explicitly stated).

The term "prodrug" means a compound that can be transformed in vivo to yield an immune response modifying compound in any of the salt, solvated, polymorphic, or isomeric forms described above. The prodrug, itself, may be an immune response modifying compound in any of the salt, solvated, polymorphic, or isomeric forms described above. The transformation may occur by various mechanisms, such as through a chemical (e.g., solvolysis or hydrolysis, for example, in the blood) or enzymatic biotransformation. A discussion of the use of prodrugs is provided by T. Higuchi and W. Stella, "Pro-drugs as Novel Delivery Systems," Vol. 14 of the A. C. S. Symposium Series, and in *Bioreversible Carriers in Drug Design*, ed. Edward B. Roche, American Pharmaceutical Association and Pergamon Press, 1987.

#### Preparation of the Compounds

Compounds of the invention may be synthesized by synthetic routes that include processes analogous to those well known in the chemical arts, particularly in light of the description contained herein. The starting materials are generally available from commercial sources such as Aldrich Chemicals (Milwaukee, Wisconsin, USA) or are readily prepared using methods well known to those skilled in the art (e.g., prepared by methods generally described in Louis F. Fieser and Mary Fieser, *Reagents for Organic Synthesis*, v. 1-19, Wiley, New York, (1967-1999 ed.); Alan R. Katritzky, Otto Meth-Cohn, Charles W. Rees, *Comprehensive Organic Functional Group Transformations*, v 1-6, Pergamon Press, Oxford, England, (1995); Barry M. Trost and Ian Fleming, *Comprehensive Organic Synthesis*, v. 1-8, Pergamon Press, Oxford, England, (1991); or *Beilsteins Handbuch der organischen Chemie*, 4, Aufl. Ed. Springer-Verlag, Berlin, Germany, including supplements (also available via the Beilstein online database)).

For illustrative purposes, the reaction schemes depicted below provide potential routes for synthesizing the compounds of the present invention as well as key intermediates. For more detailed description of the individual reaction steps, see the EXAMPLES section below. Those skilled in the art will appreciate that other synthetic routes may be used to synthesize the compounds of the invention. Although specific starting materials and reagents are depicted in the reaction schemes and discussed below,

other starting materials and reagents can be easily substituted to provide a variety of derivatives and/or reaction conditions. In addition, many of the compounds prepared by the methods described below can be further modified in light of this disclosure using conventional methods well known to those skilled in the art.

5 In the preparation of compounds of the invention it may sometimes be necessary to protect a particular functionality while reacting other functional groups on an intermediate. The need for such protection will vary depending on the nature of the particular functional group and the conditions of the reaction step. Suitable amino protecting groups include acetyl, trifluoroacetyl, *tert*-butoxycarbonyl (Boc), benzyloxycarbonyl, and 9-  
10 fluorenylmethoxycarbonyl (Fmoc). Suitable hydroxy protecting groups include acetyl and silyl groups such as the *tert*-butyldimethylsilyl group. For a general description of protecting groups and their use, see T. W. Greene and P. G. M. Wuts, *Protective Groups in Organic Synthesis*, John Wiley & Sons, New York, USA, 1991.

Conventional methods and techniques of separation and purification can be used to  
15 isolate compounds of the invention, as well as various intermediates related thereto. Such techniques may include, for example, all types of chromatography (high performance liquid chromatography (HPLC), column chromatography using common absorbents such as silica gel, and thin layer chromatography), recrystallization, and differential (i.e., liquid-liquid) extraction techniques.

20 Compounds of the Formula II where R, R', R<sub>2</sub>, n, m, and Z are as defined above can be prepared starting from 2,4-dichloro-3-nitroquinoline XV as shown in Reaction Scheme I. The route shown in Reaction Scheme I is especially useful when Z, R', and R<sub>2</sub> contain functional groups that are easily oxidized by reagents used in step (4) of Reaction Scheme II. Easily oxidizable groups include -S-, heteroaryl groups, and amines. In step  
25 (1) of Reaction Scheme I, a 2,4-dichloro-3-nitroquinoline of Formula XV is reacted with an amine of the Formula XVI or hydrochloride salt thereof to form a compound of Formula XVII. This reaction is carried out by adding a compound of Formula XVI or a salt thereof to a solution of 2,4-dichloro-3-nitroquinoline of Formula XV in the presence of a base such as triethylamine. The reaction is carried out in a suitable solvent, such as  
30 dichloromethane or chloroform. Amines of the Formula XVI and hydrochloride salts thereof can be obtained commercially or prepared according to published procedures or modified versions thereof, and according to Schemes III-V and XI. Compounds of

Formula XV are known or can be prepared using known synthetic methods, see for example, U.S. Pat. No. 4,988,815 and the documents cited therein.

The resultant compound of Formula XVII is reduced in step (2) of Reaction Scheme I to provide a quinoline-3,4-diamine of Formula XVIII. The reaction can be carried out by hydrogenation using a heterogeneous hydrogenation catalyst such as platinum on carbon or palladium on carbon. The hydrogenation is conveniently carried out in a Parr apparatus in a suitable solvent such as acetonitrile, ethyl acetate, or ethanol. The reaction can be carried out at ambient temperature, and the product can be isolated using conventional methods.

Alternatively step (2) can be carried out using a one- or two-phase sodium dithionite reduction. The reaction is conveniently carried out using the conditions described by K.K. Park et al., W. K.; *Tetrahedron Lett.*, 34, 7445-7446 (1993) by adding sodium dithionite to a compound of Formula XVII in a mixture of dichloromethane and water at ambient temperature in the presence of potassium carbonate and ethyl viologen dibromide, ethyl viologen diiodide, or 1,1'-di-*n*-octyl-4,4'-bipyridinium dibromide. The product can be isolated using conventional methods.

In step (3) of Reaction Scheme I, a quinoline-3,4-diamine of Formula XVIII is treated with a carboxylic acid equivalent to provide a 1*H*-imidazo[4,5-*c*]quinoline of Formula XIX. Suitable carboxylic acid equivalents include orthoesters of Formula  $R_2C(O\text{-alkyl})_3$ , 1,1-dialkoxyalkyl alkanoates of Formula  $R_2C(O\text{-alkyl})_2(O\text{-C(O)-alkyl})$ , and acid chlorides of Formula  $R_2C(O)Cl$ . The selection of the carboxylic acid equivalent is determined by the desired substituent at  $R_2$ . For example, ethoxyacetyl chloride will provide a compound where  $R_2$  is an ethoxymethyl group, and acetyl chloride will provide a compound where  $R_2$  is a methyl group. Step (3) can be carried out in two steps when an acid chloride of Formula  $R_2C(O)Cl$  is used as the carboxylic acid equivalent. The first step is conveniently carried out by adding the acid chloride to a solution of a quinoline-3,4-diamine of Formula XVIII in a suitable solvent such as dichloromethane in the presence of a base such as triethylamine, pyridine, or 4-dimethylaminopyridine to afford an amide. Optionally, the reaction can be performed without a tertiary amine. The reaction can be carried out starting at a sub-ambient temperature, such as 0 °C, with warming to ambient temperature or at ambient temperature. The amide product can be isolated and optionally purified using conventional techniques before it is heated and

cyclized to provide a 1*H*-imidazo[4,5-*c*]quinoline of Formula XIX. The cyclization reaction is conveniently carried out in a solvent such as ethanol or methanol in the presence of a base such as triethylamine and may be carried out at an elevated temperature, such as the reflux temperature of the solvent. The 1*H*-imidazo[4,5-*c*]quinoline of Formula XIX can be isolated using conventional methods.

Alternatively, step (3) can be carried out in one step when orthoesters of Formula  $R_2C(O\text{-alkyl})_3$  or 1,1-dialkoxyalkyl alkanoates of Formula  $R_2C(O\text{-alkyl})_2(O\text{-C(O)-alkyl})$  are used. For example, triethyl orthoformate will provide a compound where  $R_2$  is hydrogen, and trimethyl orthovalerate will provide a compound where  $R_2$  is a butyl group. The reaction is conveniently carried out by adding the carboxylic acid equivalent to a quinoline-3,4-diamine of Formula XVIII in a suitable solvent such as toluene. Optionally, catalytic pyridine hydrochloride or pyridium *p*-toluenesulfonate can be added. The reaction is carried out at an elevated temperature, such as at reflux.

In step (4) of Reaction Scheme I, a compound of Formula XIX is reacted with ammonia in a suitable solvent at elevated temperature and pressure. The product of Formula II or a pharmaceutically acceptable salt thereof can be isolated by conventional methods.

## Reaction Scheme I

5           Compounds of Formula IIa can be prepared according to Reaction Scheme II, wherein R, n, and m are as defined above, and  $Z_a$  and  $R_{2a}$  are subsets of Z and  $R_2$  as defined above that do not include those substituents that one skilled in the art would recognize as being susceptible to the oxidation in step (4) or incompatible with other functional groups present. Those substituents include  $-S-$ , heteroaryl groups, and alkyl amines. One exception is that  $-S-$  is included in the set of  $Z_a$  and is oxidized to a sulfone during step (4). Therefore,  $Z_b$  is a subset of Z that contains  $-S(O)_2-$  and all of  $Z_a$  except for  $-S-$ . In step (1) of Reaction Scheme II, a 4-chloro-3-nitroquinoline of Formula XX is reacted with an amine of the Formula XVIa or hydrochloride salt thereof to form a compound of Formula XXI. Amines of the Formula XVIa and hydrochloride salts thereof can be obtained commercially or prepared according to published procedures or modified versions thereof, and according to Schemes III-V. Many compounds of Formula XX are known or can be prepared using known synthetic methods, see for example, U.S. Pat. Nos. 4,689,338; 5,175,296; 5,367,076; and 5,389,640; and the documents cited therein. Step (1) of Reaction Scheme II is carried out as described for step (1) of Reaction Scheme I, as

10

15

20           are steps (2) and (3).

In step (4) of Reaction Scheme II, a 1*H*-imidazo[4,5-*c*]quinoline of Formula XXIII is oxidized to provide a 1*H*-imidazo[4,5-*c*]quinoline-5*N*-oxide of Formula XXIV using a conventional oxidizing agent capable of forming *N*-oxides. The reaction is conveniently carried out by adding 3-chloroperoxybenzoic acid to a solution of a compound of Formula XXIII in a solvent such as dichloromethane or chloroform. The reaction can be carried out at ambient temperature, and the product can be isolated using conventional methods.

In step (5) of Reaction Scheme II, a 1*H*-imidazo[4,5-*c*]quinoline-5*N*-oxide of Formula XXIV is aminated to provide a 1*H*-imidazo[4,5-*c*]quinolin-4-amine of Formula IIa. Step (5) can be carried out by the activation of an *N*-oxide of Formula XXIV by conversion to an ester and then reacting the ester with an aminating agent. Suitable activating agents include alkyl- or arylsulfonyl chlorides such as benzenesulfonyl chloride, methanesulfonyl chloride, or *p*-toluenesulfonyl chloride. Suitable aminating agents include ammonia, in the form of ammonium hydroxide, for example, and ammonium salts such as ammonium carbonate, ammonium bicarbonate, and ammonium phosphate. The reaction is conveniently carried out by adding ammonium hydroxide to a solution of the *N*-oxide of Formula XXIV in a suitable solvent such as dichloromethane or chloroform and then adding *p*-toluenesulfonyl chloride. The reaction can be carried out at ambient temperature. The product or pharmaceutically acceptable salt thereof can be isolated using conventional methods.

Alternatively step (5) can be carried out by the reaction of a 1*H*-imidazo[4,5-*c*]quinoline-5*N*-oxide of Formula XXIV with trichloroacetyl isocyanate followed by base-promoted hydrolysis of the resulting intermediate to provide a 1*H*-imidazo[4,5-*c*]quinolin-4-amine of Formula IIa. The reaction is conveniently carried out in two steps by (i) adding trichloroacetyl isocyanate to a solution of the *N*-oxide of Formula XXIV in a solvent such as dichloromethane and stirring at ambient temperature to provide an amide intermediate which may be isolated. In step (ii), a solution of the intermediate in methanol is treated with a base such as sodium methoxide or ammonium hydroxide at ambient temperature. The product or a pharmaceutically acceptable salt thereof can be isolated using conventional methods.

Steps (4) and (5) of Reaction Scheme II may be carried out as a one-pot procedure by adding 3-chloroperoxybenzoic acid to a solution of a compound of Formula XXIII in a solvent such as dichloromethane or chloroform and then adding ammonium hydroxide and

*p*-toluenesulfonyl chloride without isolating the *N*-oxide compound of Formula XXIV. The product of Formula IIa or pharmaceutically acceptable salt thereof can be isolated by conventional methods.

## Reaction Scheme II

The amine of the Formula XVI where *m* is 1, *R'* is -OH, and *Z* is -CH<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>- can be obtained commercially as the hydrochloride salt. Some amines of the Formula XVI can be prepared according to published procedures or modified versions thereof. For example, the amine of Formula XVI where *m* is 2, *R'* is -OH, and *Z* is -CH<sub>2</sub>CH<sub>2</sub>CH<sub>2</sub>- has been prepared previously by J. Bicking et al., *J. Med. Chem.*, 26, 342-348 (1983). The route described by J. Bicking et al. may also be applied toward the synthesis of many amines of Formula XVI where *m* is 2 and *R'* is -OH. In a publication by I.L. Lysenko et al., *Russ. J. Org. Chem.*, 37, 1238-1243 (2001), the synthesis of the amine of Formula XVI where *m* is 1, *R'* is -OH, and *Z* is a bond has been described. The synthesis of the amine of Formula XVI where *m* is 3, *R'* is -OH, and *Z* is a bond from butyrolactone has been published by A. Esposito et al., *J. Org. Chem.*, 65, 9245-9248

(2000). The method described by A. Esposito et al. may be applied toward the synthesis of amines of Formula XVI where m is 2, 4, and 5, R' is -OH, and Z is a bond starting from the appropriate commercially available lactones. Other amines of Formula XVI where R' is -OH may be prepared according to Schemes III – V.

5           Amines of the Formula XVIb where Z is defined as above and hydrochloride salts thereof can be prepared according to Reaction Scheme III. In step (1) of Reaction Scheme III, a ketone of Formula XXV can be treated with excess nitromethane in a suitable solvent such as ethanol or methanol in the presence of a catalytic amount of base such as sodium ethoxide or sodium hydroxide to provide a compound of Formula XXVI. A wide  
10       variety of ketones of Formula XXV can be obtained from commercial sources or can be synthesized using known synthetic methods. The reaction can be carried out at ambient temperature. The product of Formula XXVI can be isolated using conventional methods.

          Step (2) of Reaction Scheme III can be carried out by hydrogenation using a heterogeneous hydrogenation catalyst such as palladium hydroxide on carbon or palladium  
15       on carbon or Raney nickel. The hydrogenation is conveniently carried out in a Parr apparatus in a suitable solvent such as ethanol or methanol. The reaction can be carried out at ambient temperature, and the product amino alcohol of Formula XVIb can be isolated using conventional methods.

          Alternatively, amino alcohols of Formula XVIb can be prepared by treating a  
20       ketone of Formula XXV with a cyanide source, such as trimethylsilylcyanide, in the presence of a catalytic amount of a crown ether, such as 18-crown-6, and a catalytic amount of a cyanide source, such as potassium cyanide. The intermediate cyanohydrin is then reduced with a hydride reducing agent, such as lithium aluminum hydride. The reduction may be carried out at a sub-ambient temperature, such as 0 °C, in a suitable  
25       solvent such as THF, and the amino alcohol of Formula XVIb can be isolated by conventional methods.

## Reaction Scheme III

Reaction Scheme IV shows the synthesis of amines of Formula XVIc where  $m'$  may equal 0-3, Z is defined as above, and TBS- is a *tert*-butyldimethylsilyl group. In step (1), a ketone of Formula XXV is treated with an organometallic reagent of the Formula  $\text{H}_2\text{C}=\text{CH}_2(\text{CH}_2)_m\text{M}$  where M is MgCl, MgBr, MgI, ZnBr, ZnI, or Li, or the product of such reagent with  $\text{CeCl}_3$ . The organometallic reagents are commercially available or can be prepared from  $\text{H}_2\text{C}=\text{CH}_2(\text{CH}_2)_m\text{X}$ , where X is a chloride or preferably a bromide or iodide. The reaction can be carried out in an appropriate solvent such as tetrahydrofuran or diethyl ether. The resulting tertiary alcohol of Formula XXVII can be isolated using conventional methods.

In step (2) of Reaction Scheme IV, the newly formed tertiary alcohol of Formula XXVII is protected as a *tert*-butyldimethylsilyl (TBS) ether to yield the product of Formula XXVIII. The tertiary alcohol of Formula XXVII can be reacted with *tert*-butyldimethylsilyl chloride or *tert*-butyldimethylsilyl triflate with a base such as pyridine, 2,6-lutidine, triethylamine, or ethyldiisopropylamine in an appropriate solvent such as acetonitrile or dichloromethane optionally with a catalytic amount of dimethylaminopyridine. The resulting compound of Formula XXVIII can be isolated using conventional methods.

In step (3) of Reaction Scheme IV, the terminal olefin of Formula XXVIII undergoes hydroboration and subsequent oxidation to provide a primary alcohol of Formula XXIX. The two step procedure is carried out by first adding a reagent such as borane, catecholborane or 9-borabicyclo(3.3.1)nonane with or without  $(\text{PPh}_3)_3\text{RhCl}$  present in an appropriate solvent such as tetrahydrofuran to generate an alkyl borane intermediate. Sodium hydroxide and an aqueous solution of hydrogen peroxide are added

to convert the intermediate to the product of Formula XXIX, which can be isolated using conventional methods.

In step (4) of Reaction Scheme IV, the primary alcohol of Formula XXIX is reacted with methanesulfonyl chloride to yield a compound of Formula XXX. The reaction is conveniently carried out in a solvent such as dichloromethane in the presence of a base such as triethylamine. The reaction may be carried out starting at a sub-ambient temperature, such as 0 °C, with warming to ambient temperature. The resulting compound of Formula XXX can be isolated using conventional methods.

In step (5) of Reaction Scheme IV, the compound of Formula XXX may be reacted with sodium azide in a suitable solvent such as dimethylformamide. The reaction may be carried out at ambient temperature or at elevated temperature. The resulting compound of Formula XXXI can be isolated using conventional methods.

In step (6) of Reaction Scheme IV, the *tert*-butyldimethylsilyl (TBS) group is removed from the compound of Formula XXXI to generate the alcohol in a compound of Formula XXXII. Typically, a compound of Formula XXXI is treated with a fluoride source such as tetrabutylammonium fluoride in a suitable solvent such as tetrahydrofuran with or without acetic acid added. Alternatively, hydrogen fluoride-pyridine may be used in a suitable solvent such as tetrahydrofuran optionally with pyridine added to the reaction. The reaction can be carried out at ambient temperature. The resulting compound of Formula XXXII can be isolated using conventional methods.

In step (7) of Reaction Scheme IV, a compound of Formula XXXII can be reduced to provide a amino alcohol of Formula XVIc. The reaction can be carried out by hydrogenation using a heterogeneous hydrogenation catalyst such as palladium on carbon. The hydrogenation is conveniently carried out in a Parr apparatus in a suitable solvent such as ethanol. The reaction can be carried out at ambient temperature, and the product of Formula XVIc where R'<sub>a</sub> is -OH can be isolated using conventional methods.

In step (7a) of Reaction Scheme IV, an azide of Formula XXXI may be reduced using the conditions described in step (7) of Reaction Scheme IV to yield the corresponding amine of Formula XVIc where R'<sub>a</sub> is -OTBS, which may be used in place of an amine of Formula XVIa in Reaction Scheme II. Subsequent removal of the *tert*-butyldimethylsilyl protecting group after completion of step (4) of Reaction Scheme II using aqueous hydrogen chloride in a suitable solvent such as methanol or using the

conditions described for step (6) in Reaction Scheme IV ultimately provides a compound of Formula XXIII, which can be converted to a compound of Formula IIa.

Reaction Scheme IV

5

Reaction Scheme V shows a general synthesis of amines of Formula XVIId where  $m$  equals 1-5 and Bz is a benzyl group. Compounds of the Formula XXXIII are used as the starting material and can be obtained from commercial sources or can be readily synthesized as described by R.K. Olsen et al., *J. Org. Chem.*, 47, 4605-4611 (1982), S. Kobayashi et al., *Syn. Lett.*, 909-912 (1999), and C.F. Garcia et al., *J. Chem. Soc. Chem. Commun.*, 12, 1465-1466 (1996). In step (1) of Reaction Scheme V, a cyclopropane of Formula XXXIV is formed upon treatment of the starting material of Formula XXXIII with ethylmagnesium bromide in the presence of titanium(IV) isopropoxide in a suitable

10

solvent such as tetrahydrofuran at sub-ambient temperature. The product of Formula XXXIV can be isolated using conventional methods.

In step (2) of reaction Scheme V, a compound of Formula XVIId is prepared by the reduction of compound of Formula XXXIV. The reaction can be carried out by hydrogenation using a heterogeneous hydrogenation catalyst such as palladium on carbon. The hydrogenation is conveniently carried out in a Parr apparatus using a suitable solvent such as ethanol, methanol, or ethyl acetate. The reaction can be performed at ambient temperature, and the product of Formula XVIId can be isolated using conventional methods.

#### Reaction Scheme V

Functional group transformations in a compound of Formula XXIII are possible using known synthetic methods. For example, as shown in step (1) of Reaction Scheme VI, a compound of Formula XXIII where  $Z_a = -(\text{CH}_2)_{0-3}-\text{NBoc}-(\text{CH}_2)_{0-3}-$  (Boc is defined as *tert*-butyloxycarbonyl) can be treated with acid to remove the Boc group to yield an amine of Formula XXXV. In step (2) of Reaction Scheme VI, an amine of Formula XXXV can react with an acid chloride of Formula  $\text{R}_4\text{C}(\text{O})\text{Cl}$ , an alkyl chloroformate of Formula  $\text{R}_4\text{OC}(\text{O})\text{Cl}$ , a sulfonyl chloride of Formula  $\text{R}_4\text{S}(\text{O})_2\text{Cl}$ , a sulfonic anhydride of Formula  $(\text{R}_4\text{S}(\text{O})_2)_2\text{O}$ , or an acid anhydride of the Formula  $(\text{R}_4\text{C}(\text{O}))_2\text{O}$  to provide compound of Formula XXIII in which  $Z_a$  is  $-\text{CH}_2-\text{A}'-\text{CH}_2-$  and  $\text{A}'$  is  $-\text{N}(\text{Q}-\text{R}_4)$  where  $\text{R}_4$  is defined as above and  $\text{Q}$  is  $-\text{C}(\text{O})-$ ,  $-\text{C}(\text{O})\text{O}-$ ,  $-\text{S}(\text{O})_2-$ . Numerous acid chlorides, alkyl chloroformates, sulfonyl chlorides, and sulfonic anhydrides are commercially available; others can be prepared readily using known synthetic methods. The reaction can be conveniently carried out by adding the acid chloride, alkyl chloroformate, sulfonyl chloride, sulfonic anhydride, or acid anhydride to a solution of amine of Formula XXXV in a suitable solvent such as pyridine. The reaction can be carried out at ambient temperature and the product can be isolated using conventional methods. In step (3) of

Reaction Scheme VI, the tertiary hydroxy group of a 1*H*-imidazo[4,5-*c*]quinoline of Formula XXIII can be alkylated to produce an ether of Formula XXXVI. The reaction is conveniently carried out in a suitable solvent such as tetrahydrofuran using a base such as sodium hydride or potassium hydride to first deprotonate the alcohol, followed by addition of an alkyl iodide or alkyl triflate. The reaction can be carried out at elevated temperature. Alternatively, the hydroxy group can be reacted with methyl vinyl sulfone after treatment with a sub-stoichiometric amount of sodium hydride in a suitable solvent such as tetrahydrofuran at ambient temperature. The product of Formula XXXVI can be isolated using conventional methods. Steps (4) and (5) can be carried out as described for steps (4) and (5) of Reaction Scheme II to provide a compound of Formula IIb.

Reaction Scheme VI

For some embodiments, compounds shown in Reaction Schemes I and II can be further elaborated using conventional synthetic methods. For example, as shown in Scheme VII, a compound of Formula IIa, where Z is  $-(\text{CH}_2)_{0-3}-\text{NBoc}-(\text{CH}_2)_{0-3}-$  and Boc is defined as *tert*-butoxycarbonyl, can undergo acid mediated cleavage of the Boc group in step (1) to give a secondary amine that can be functionalized in step (2) with an acid chloride of Formula  $\text{R}_4\text{C}(\text{O})\text{Cl}$ , an alkyl chloroformate of Formula  $\text{R}_4\text{OC}(\text{O})\text{Cl}$ , a sulfonyl

chloride of Formula  $R_4S(O)_2Cl$ , a sulfonic anhydride of Formula  $(R_4S(O)_2)_2O$ , an isocyanate of formula  $R_4NCO$ , or an isothiocyanate of formula  $R_4NCS$  to provide a compound of Formula IId in which Z is  $-(CH_2)_{0-3}-A'-(CH_2)_{0-3}-$  and A' is  $-N(Q-R_4)$  where  $R_4$  is defined as above and Q is  $-C(O)-$ ,  $-C(O)O-$ ,  $-S(O)_2-$ ,  $-C(O)NH-$ , or  $-C(S)NH-$ .

5 Alternatively, a compound of Formula XXIII in Reaction Scheme II, where  $Z_a = -(CH_2)_{0-3}-NBoc-(CH_2)_{0-3}-$  for example, can be treated with acid to remove the Boc group. The resulting amine can react further with an acid chloride of Formula  $R_4C(O)Cl$ , an alkyl chloroformate of Formula  $R_4OC(O)Cl$ , a sulfonyl chloride of Formula  $R_4S(O)_2Cl$ , a sulfonic anhydride of Formula  $(R_4S(O)_2)_2O$ , or an isocyanate of formula  $R_4NCO$  before  
10 step (4) of Reaction Scheme II. The product can then be treated according to steps (4) and (5) of Reaction Scheme II to provide compound of Formula IId in which Z is  $-(CH_2)_{0-3}-A'-(CH_2)_{0-3}-$  and A' is  $-N(Q-R_4)$  where  $R_4$  is defined as above and Q is  $-C(O)-$ ,  $-C(O)O-$ ,  $-S(O)_2-$ , or  $-C(O)NH-$ . Numerous acid chlorides, alkyl chloroformates, sulfonyl chlorides, sulfonic anhydrides, isocyanates, and isothiocyanates are commercially  
15 available; others can be prepared readily using known synthetic methods. The reaction can be conveniently carried out by adding the acid chloride, alkyl chloroformate, sulfonyl chloride, sulfonic anhydride, isocyanate, or isothiocyanate to a solution of amine of Formula IIc or XXIII, in which Z or  $Z_a$  contains a secondary amine in a suitable solvent such as pyridine. The reaction can be carried out at ambient temperature.

20 In addition, a compound of Formula IIc in Reaction Scheme VII can undergo alkylation of the secondary amine. In step (3) the compound of Formula IIc may react with aldehydes, alkyl halides or triflates to provide a compound Formula IIe in which  $R_8$  is defined as above. For example, treatment of a compound of Formula IIc with aqueous formaldehyde and a reducing agent such as sodium cyanoborohydride in an appropriate  
25 solvent such as methanol yields a compound of Formula IIe, where  $R_8$  is a methyl group.

## Reaction Scheme VII

Compounds of the invention of Formula IIc and IId can be prepared according to Reaction Scheme VIII, wherein R, n, Z<sub>a</sub>, Z<sub>b</sub>, and R<sub>2a</sub> are defined as above. In step (1) of Reaction Scheme VIII, a 4-chloro-3-nitroquinoline of Formula XX is reacted with an amine of the Formula XVIe or a salt thereof to form a compound of Formula XXXVIII. This reaction is carried out as described for step (1) in Reaction Scheme I. Amines of the Formula XVIe and salts thereof can be prepared according to published procedures or modified versions thereof, or by using conventional synthetic methods. For example, the synthesis of amines of the Formula XVI where m is one, R' = NH<sub>2</sub> and Z is -(CH<sub>2</sub>)<sub>2-4</sub>-, and -CH<sub>2</sub>(NCH<sub>3</sub>)CH<sub>2</sub>- has been published by M.A. Fernandez et al., *Anales de la Real Academia de Farmacia*, 54, 502-510 (1988). The starting materials used by M. A. Fernandez et al. were ketones of Formula XXV. A wide variety of ketones of Formula XXV can be obtained from commercial sources or can be synthesized. Those ketones of Formula XXV may be used in the synthesis of amines of Formula XVI where m is one, R' = NH<sub>2</sub> and Z is as described above. Similar chemistry to that published by Fernandez et

al. that is also relevant has been published by S.L. Deng et al., *Synthesis*, 2445-2449 (2001), A.A. Cordi et al., *J. Med. Chem.*, 44, 787-805 (2001), and M. Freifelder et al., *J. Amer. Chem. Soc.*, 82, 696-698 (1960). In addition, the amine of Formula XVIe wherein m is one and Z<sub>a</sub> is a bond has been synthesized previously by F. Vergne et al., *J. Org. Chem.*, 57, 6071-6075 (1992). Many compounds of Formula XX are known or can be prepared using known synthetic methods, see for example, U.S. Pat. Nos. 4,689,338; 5,175,296; 5,367,076; and 5,389,640; and the documents cited therein.

In step (2) of Reaction Scheme VIII, the primary amine in a compound of Formula XXXVIII is converted into a *tert*-butyl carbamate to provide a compound of Formula XXXIX. The reaction is conveniently carried out using di-*tert*-butyldicarbonate in the presence of a base such as aqueous sodium hydroxide in a solvent such as tetrahydrofuran. The compound of Formula XXXIX can be isolated using conventional methods.

Steps (3), (4), (5), and (6) of Reaction Scheme VIII can be carried out as described for steps (2), (3), (4), and (5), respectively, of Reaction Scheme II to provide a compound of Formula II<sub>f</sub>.

In step (7) of Reaction Scheme VIII, the *tert*-butyl carbamate in a compound of Formula II<sub>f</sub> is converted to a primary amine of Formula II<sub>g</sub>. The reaction is conveniently performed in the presence of an acid such as hydrogen chloride in a suitable solvent such as ethanol. The reaction is performed at elevated temperature and the product of Formula II<sub>g</sub> or a pharmaceutically acceptable salt thereof is isolated using conventional methods.

## Reaction Scheme VIII

5

For some embodiments, compounds shown in Reaction Scheme VIII can be further elaborated using conventional synthetic methods. For example, as shown in Scheme IX, a compound of Formula XLI can undergo acid mediated cleavage of the Boc group in step (1) to give a primary amine of Formula XLIII that can be functionalized with the reagents described in step (2) of Reaction Scheme VII to provide a compound of Formula XLIV in which where  $R_4$  is defined as above and Q is  $-C(O)-$ ,  $-C(O)O-$ ,  $-S(O)_2-$ ,  $-C(O)NH-$ , or

10

-C(S)NH-. The reaction can be carried out in an appropriate solvent such as dichloromethane in the presence of a tertiary amine such as triethylamine, or can be performed in pyridine. Optionally, dimethylaminopyridine may be used in the reaction. The reaction is carried out at ambient temperature. Steps (3) and (4) of Reaction Scheme IX can be carried out as described for steps (4) and (5) in Reaction Scheme II to yield a compound of Formula IIh. If  $Z_b$  in a compound of Formula IIh contains an appropriately protected amine, deprotection will provide a free amine that may be functionalized with the reagents described in step (2) of Reaction Scheme VII.

Reaction Scheme IX

Compounds of the Formula IIi can be prepared according to Reaction Scheme X, wherein  $R$ ,  $n$ , and  $m$  are as defined above, and  $Z_a$ ,  $Z_b$  and  $R_{2a}$  are subsets of  $Z$  and  $R_2$  as defined above. In step (1) of Reaction Scheme X, 4-chloro-3-nitroquinoline of Formula XX is reacted with an amine of the Formula XVI<sub>f</sub> or hydrochloride salt thereof to form a compound of Formula XLV. Step (1) of Reaction Scheme X is carried out as described for step (1) in Reaction Scheme II. Steps (2), (3), (4), and (5) of Reaction Scheme X can

be carried out as described for steps (2), (3), (4), and (5), respectively, of Reaction Scheme II to provide a compound of Formula Iii or a pharmaceutically active salt thereof.

## Reaction Scheme X

5

Some amines of the Formula XVI f and hydrochloride salts thereof can be prepared according to Reaction Scheme XI and by conventional synthetic methods. In step (1) of Reaction Scheme XI, a ketone of Formula XXV is treated nitromethane and an alkyl thiol in the presence of a base in an appropriate solvent by modifying the procedure of W.W. Lin et al., *J. Org. Chem.*, 66, 1984-1991 (2001) to yield a compound of Formula XLIX.

In step (2) of Reaction Scheme XI, a compound of Formula XLIX is reduced using lithium aluminum hydride or hydrogenated using a heterogeneous hydrogenation catalyst

palladium on carbon. The product of Formula XVI<sub>f</sub> or salt thereof can be isolated using conventional methods.

Compounds of Formula II where R' is a sulfide and R, R<sub>2</sub>, n, m, and Z are as defined above can be prepared according to the route shown in Reaction Scheme I using an amine of Formula XVI<sub>f</sub> as the starting material.

Reaction Scheme XI

As shown in Reaction Scheme XII, an 1*H*-imidazo[4,5-*c*]quinoline of Formula II<sub>j</sub> can be reduced to a 6,7,8,9-tetrahydro-1*H*-imidazo[4,5-*c*]quinolin-4-amine of Formula III<sub>a</sub> where Z and R' are as defined above and R<sub>2b</sub> and R<sub>b</sub> are subsets of R<sub>2</sub> and R as defined above that do not include substituents that one skilled in the art would recognize as being susceptible to reduction under the acidic hydrogenation conditions of step (1). Those susceptible groups include, for example, alkenyl, alkynyl, aryl groups, and groups bearing nitro substituents. The reaction is conveniently carried out under heterogeneous hydrogenation conditions by adding platinum (IV) oxide to a solution of the compound of Formula II<sub>j</sub> in trifluoroacetic acid and placing the reaction under hydrogen pressure. The reaction can be carried out on a Parr apparatus at ambient temperature. The product or pharmaceutically acceptable salt thereof can be isolated by conventional methods.

## Reaction Scheme XII

For some embodiments, compounds of the invention are prepared according to Reaction Scheme XIII, where Z, R', R<sub>2</sub>, R<sub>A</sub>, and R<sub>B</sub> are as defined above. In step (1) of Reaction Scheme XIII, a 2,4-dichloro-3-nitropyridine of Formula LI is reacted with an amine of Formula XVI or a hydrochloride salt thereof to form a 2-chloro-3-nitropyridine of Formula LII. The reaction is conveniently carried out by combining an amine of Formula XVI or a hydrochloride salt thereof and 2,4-dichloro-3-nitropyridine of Formula LI in the presence of a base such as triethylamine in a solvent such as N,N-dimethylformamide (DMF). The reaction can be carried out at ambient temperature or above, and the product can be isolated from the reaction mixture using conventional methods. Many 2,4-dichloro-3-nitropyridines of Formula LI are known and can be readily prepared using known synthetic methods. (See, for example, U.S. Pat. No. 6,525,064 (Dellaria et al.) and the references cited therein.)

In step (2) of Reaction Scheme XIII, a 2-chloro-3-nitropyridine of Formula LII is reacted with dibenzylamine to provide a compound of Formula LIII. The reaction can be carried out by combining the compound of Formula LII with dibenzylamine and a tertiary amine such as triethylamine in a suitable solvent such as toluene. The reaction can be carried out at elevated temperature and the product of Formula LIII is isolated from the reaction mixture using conventional methods.

In step (3) of Reaction Scheme XIII, a compound of formula LIII is reduced to provide a compound of Formula LIV. The reduction can be carried out by hydrogenation using a conventional heterogeneous catalyst, for example, platinum on carbon or palladium on carbon. The reaction can conveniently be carried out on a Parr apparatus in

a suitable solvent such as acetonitrile or ethyl acetate. The product of Formula LIV can be isolated from the reaction mixture using conventional methods.

In step (4) of reaction Scheme XIII, a compound of Formula LIV is reacted with a carboxylic acid equivalent to provide a compound of Formula LV. The reaction can be carried out as described in step (3) of Reaction Scheme I, and the product can be isolated from the reaction mixture using conventional methods.

A compound of Formula LV may also be prepared by subjecting a compound of Formula LII to the reaction conditions in described in steps (3) and (4) to provide a 4-chloroimidazopyridine which may then be treated with dibenzylamine in a microwave to provide a compound of Formula LV.

In step (5) of reaction Scheme XIII, the benzyl groups of a compound of Formula LV are cleaved to provide a compound of Formula III. The reaction can be carried out by transfer hydrogenation in the presence of a suitable hydrogenation catalyst. The transfer hydrogenation is conveniently carried out by adding ammonium formate to a solution of a compound of Formula LV in a suitable solvent such as ethanol or methanol in the presence of a catalyst such as palladium on carbon. The reaction is carried out at an elevated temperature, for example, the reflux temperature of the solvent. The product of Formula III or pharmaceutically acceptable salt thereof can be isolated using conventional methods.

## Reaction Scheme XIII

5 Compounds of the invention can be prepared according to Reaction Scheme XIV, wherein R, Z<sub>a</sub>, Z<sub>b</sub>, R<sub>2a</sub> and m are as defined above. Reaction Scheme XIV begins with a 4-chloro-3-nitro[1,5]naphthyridine of Formula LVI. Compounds of Formula LVI and their preparation are known; see, for example, U.S. Pat. Nos. 6,194,425 (Gerster) and 6,518,280 (Gerster). Steps (1) through (5) of Reaction Scheme XIV can be carried out as described

10 for the corresponding steps (1) through (5) of Reaction Scheme II to provide a substituted 1H-imidazo[4,5-c]-1,5-naphthyridin-4-amine of Formula IVa. The product or pharmaceutically acceptable salt thereof can be isolated by conventional methods.

## Reaction Scheme XIV

For some embodiments, naphthyridines of the invention are prepared from tetrazolo compounds of Formulas LVIII and LXI according to Reaction Scheme XV, wherein R, R', R<sub>2</sub>, m, and Z are as defined above and -OTf is a trifluoromethanesulfonate group. Compounds of Formula LVIII and LXI and synthetic routes to these compounds are known; see, for example, U.S. Pat. Nos. 6,194,425 (Gerster) and 6,518,280 (Gerster).

In steps (1) and (1a) of Reaction Scheme XV, a tetrazolonaphthyridine of Formula LVIII or LXI is reacted with an amine of Formula XVI or a hydrochloride salt thereof to form a compound of Formula LIX or LXII. The reaction can be carried out as described in step (1) of Reaction Scheme I. A compound of Formula LIX or LXII is converted to a compound of Formula LX or LXIII according to the methods of steps (2) and (3) of Reaction Scheme I. The tetrazolo group of a compound of Formula LX or LXIII can then be removed to provide a 1*H*-imidazo[4,5-*c*]naphthyridin-4-amine of Formula VII or VIII. The removal of the tetrazolo group can be carried out by methods described in U.S. Pat. Nos. 6,194,425 (Gerster) and 6,518,280 (Gerster). The product or pharmaceutically acceptable salt thereof can be isolated by conventional methods.

## Reaction Scheme XV

Compounds of the invention can also be prepared using variations of the synthetic routes shown in Reaction Schemes I through XV. For example, tetrahydronaphthyridines can be prepared using the method described in Reaction Scheme XII for the preparation of tetrahydroquinolines. Compounds of the invention can also be prepared using the synthetic routes described in the EXAMPLES below.

Prodrugs can be prepared in a variety of ways. For example, a compound wherein  $R_2$  is  $-X-OH$  can be converted into a prodrug wherein  $R_2$  is, for example,  $-X-O-C(R_6)-R_4$ ,  $-X-O-C(R_6)-O-R_4$ , or  $-X-O-C(R_6)-N(R_8)-R_4$ , wherein  $R_4$ ,  $R_6$ , and  $R_8$  are as defined above, using methods known to one skilled in the art. In addition, a compound wherein  $R'$  or  $R$  is hydroxy may also be converted to an ester, an ether, a carbonate, or a carbamate. For any of these compounds containing an alcohol functional group, a prodrug can be formed by the replacement of the hydrogen atom of the alcohol group with a group such as  $C_{1-6}$  alkanoyloxymethyl, 1-( $C_{1-6}$  alkanoyloxy)ethyl, 1-methyl-1-( $C_{1-6}$  alkanoyloxy)ethyl,  $C_{1-6}$  alkoxy carbonyloxymethyl,  $N$ -( $C_{1-6}$  alkoxy carbonyl)aminomethyl, succinoyl,  $C_{1-6}$  alkanoyl,  $\alpha$ -amino  $C_{1-4}$  alkanoyl, arylacyl,  $-P(O)(OH)_2$ ,  $-P(O)(O-C_{1-6} \text{ alkyl})_2$ ,  $C_{1-6}$  alkoxy carbonyl,  $C_{1-6}$  alkyl carbamoyl, and  $\alpha$ -aminoacyl or  $\alpha$ -aminoacyl- $\alpha$ -aminoacyl, where each  $\alpha$ -aminoacyl group is independently selected from racemic, D-, and L-amino

acids. For compounds containing an alcohol functional group, particularly useful prodrugs are esters made from carboxylic acids containing one to six carbon atoms, unsubstituted or substituted benzoic acid esters, or esters made from racemic, D-, or L-amino acids.

Prodrugs can also be made from a compound containing an amino group by conversion of the amino group to a functional group such as an amide, carbamate, urea, amidine, or another hydrolysable group using conventional methods. A prodrug of this type can be made by the replacement of a hydrogen atom in an amino group, particularly the amino group at the 4-position, with a group such as -C(O)-R",  $\alpha$ -aminoacyl,  $\alpha$ -aminoacyl- $\alpha$ -aminoacyl, -C(O)-O-R", -C(O)-N(R''')-R", -C(=NY')-R", -CH(OH)-C(O)-OY', -CH(OC<sub>1-4</sub> alkyl)Y<sub>0</sub>, -CH<sub>2</sub>Y<sub>1</sub>, or -CH(CH<sub>3</sub>)Y<sub>1</sub>; wherein R" and R''' are each independently C<sub>1-10</sub> alkyl, C<sub>3-7</sub> cycloalkyl, or benzyl, each of which may be unsubstituted or substituted by one or more substituents selected from the group consisting of halogen, hydroxy, nitro, cyano, carboxy, C<sub>1-6</sub> alkyl, C<sub>1-4</sub> alkoxy, aryl, heteroaryl, arylC<sub>1-4</sub> alkylenyl, heteroarylC<sub>1-4</sub> alkylenyl, haloC<sub>1-4</sub> alkylenyl, haloC<sub>1-4</sub> alkoxy, -O-C(O)-CH<sub>3</sub>, -C(O)-O-CH<sub>3</sub>, -C(O)-NH<sub>2</sub>, -O-CH<sub>2</sub>-C(O)-NH<sub>2</sub>, -NH<sub>2</sub>, and -S(O)<sub>2</sub>-NH<sub>2</sub>, with the proviso that R''' can also be hydrogen; each  $\alpha$ -aminoacyl group is independently selected from racemic, D-, and L-amino acids; Y' is hydrogen, C<sub>1-6</sub> alkyl, or benzyl; Y<sub>0</sub> is C<sub>1-6</sub> alkyl, carboxyC<sub>1-6</sub> alkylenyl, aminoC<sub>1-4</sub> alkylenyl, mono-*N*-C<sub>1-6</sub> alkylaminoC<sub>1-4</sub> alkylenyl, or di-*N,N*-C<sub>1-6</sub> alkylaminoC<sub>1-4</sub> alkylenyl; and Y<sub>1</sub> is mono-*N*-C<sub>1-6</sub> alkylamino, di-*N,N*-C<sub>1-6</sub> alkylamino, morpholin-4-yl, piperidin-1-yl, pyrrolidin-1-yl, or 4-C<sub>1-4</sub> alkylpiperazin-1-yl.

#### Pharmaceutical Compositions and Biological Activity

Pharmaceutical compositions of the invention contain a therapeutically effective amount of a compound or salt of the invention as described above in combination with a pharmaceutically acceptable carrier.

The terms "a therapeutically effective amount" and "effective amount" mean an amount of the compound or salt sufficient to induce a therapeutic or prophylactic effect, such as cytokine induction, immunomodulation, antitumor activity, and/or antiviral activity. Although the exact amount of active compound or salt used in a pharmaceutical composition of the invention will vary according to factors known to those of skill in the art, such as the physical and chemical nature of the compound or salt, the nature of the

carrier, and the intended dosing regimen, it is anticipated that the compositions of the invention will contain sufficient active ingredient to provide a dose of about 100 nanograms per kilogram (ng/kg) to about 50 milligrams per kilogram (mg/kg), preferably about 10 micrograms per kilogram ( $\mu$ g/kg) to about 5 mg/kg, of the compound or salt to the subject. A variety of dosage forms may be used, such as tablets, lozenges, capsules, parenteral formulations, syrups, creams, ointments, aerosol formulations, transdermal patches, transmucosal patches and the like.

The compounds or salts of the invention can be administered as the single therapeutic agent in the treatment regimen, or the compounds or salts of the invention may be administered in combination with one another or with other active agents, including additional immune response modifiers, antivirals, antibiotics, antibodies, proteins, peptides, oligonucleotides, etc.

Compounds or salts of the invention have been shown to induce the production of certain cytokines in experiments performed according to the test set forth below. These results indicate that the compounds or salts are useful as immune response modifiers that can modulate the immune response in a number of different ways, rendering them useful in the treatment of a variety of disorders.

Cytokines whose production may be induced by the administration of compounds or salts of the invention generally include interferon- $\alpha$  (IFN- $\alpha$ ) and/or tumor necrosis factor- $\alpha$  (TNF- $\alpha$ ) as well as certain interleukins (IL). Cytokines whose biosynthesis may be induced by compounds or salts of the invention include IFN- $\alpha$ , TNF- $\alpha$ , IL-1, IL-6, IL-10 and IL-12, and a variety of other cytokines. Among other effects, these and other cytokines can inhibit virus production and tumor cell growth, making the compounds or salts useful in the treatment of viral diseases and neoplastic diseases. Accordingly, the invention provides a method of inducing cytokine biosynthesis in an animal comprising administering an effective amount of a compound or salt or composition of the invention to the animal. The animal to which the compound or salt or composition is administered for induction of cytokine biosynthesis may have a disease as described *infra*, for example a viral disease or a neoplastic disease, and administration of the compound or salt may provide therapeutic treatment. Alternatively, the compound or salt may be administered to the animal prior to the animal acquiring the disease so that administration of the compound or salt may provide a prophylactic treatment.

In addition to the ability to induce the production of cytokines, compounds or salts of the invention can affect other aspects of the innate immune response. For example, natural killer cell activity may be stimulated, an effect that may be due to cytokine induction. The compounds or salts may also activate macrophages, which in turn stimulate secretion of nitric oxide and the production of additional cytokines. Further, the compounds or salts may cause proliferation and differentiation of B-lymphocytes.

Compounds or salts of the invention can also have an effect on the acquired immune response. For example, the production of the T helper type 1 (T<sub>H</sub>1) cytokine IFN- $\gamma$  may be induced indirectly and the production of the T helper type 2 (T<sub>H</sub>2) cytokines IL-4, IL-5 and IL-13 may be inhibited upon administration of the compounds or salts.

Whether for prophylaxis or therapeutic treatment of a disease, and whether for effecting innate or acquired immunity, the compound or salt or composition may be administered alone or in combination with one or more active components as in, for example, a vaccine adjuvant. When administered with other components, the compound or salt and other component or components may be administered separately; together but independently such as in a solution; or together and associated with one another such as (a) covalently linked or (b) non-covalently associated, e.g., in a colloidal suspension.

Conditions for which compounds or salts identified herein may be used as treatments include, but are not limited to:

(a) viral diseases such as, for example, diseases resulting from infection by an adenovirus, a herpesvirus (e.g., HSV-I, HSV-II, CMV, or VZV), a poxvirus (e.g., an orthopoxvirus such as variola or vaccinia, or molluscum contagiosum), a picornavirus (e.g., rhinovirus or enterovirus), an orthomyxovirus (e.g., influenzavirus), a paramyxovirus (e.g., parainfluenzavirus, mumps virus, measles virus, and respiratory syncytial virus (RSV)), a coronavirus (e.g., SARS), a papovavirus (e.g., papillomaviruses, such as those that cause genital warts, common warts, or plantar warts), a hepadnavirus (e.g., hepatitis B virus), a flavivirus (e.g., hepatitis C virus or Dengue virus), or a retrovirus (e.g., a lentivirus such as HIV);

(b) bacterial diseases such as, for example, diseases resulting from infection by bacteria of, for example, the genus *Escherichia*, *Enterobacter*, *Salmonella*, *Staphylococcus*, *Shigella*, *Listeria*, *Aerobacter*, *Helicobacter*, *Klebsiella*, *Proteus*, *Pseudomonas*, *Streptococcus*, *Chlamydia*, *Mycoplasma*, *Pneumococcus*, *Neisseria*, *Clostridium*, *Bacillus*,

Corynebacterium, Mycobacterium, Campylobacter, Vibrio, Serratia, Providencia, Chromobacterium, Brucella, Yersinia, Haemophilus, or Bordetella;

(c) other infectious diseases, such as chlamydia, fungal diseases including but not limited to candidiasis, aspergillosis, histoplasmosis, cryptococcal meningitis, or parasitic diseases including but not limited to malaria, pneumocystis carinii pneumonia, leishmaniasis, cryptosporidiosis, toxoplasmosis, and trypanosome infection;

(d) neoplastic diseases, such as intraepithelial neoplasias, cervical dysplasia, actinic keratosis, basal cell carcinoma, squamous cell carcinoma, renal cell carcinoma, Kaposi's sarcoma, melanoma, leukemias including but not limited to myelogenous leukemia, chronic lymphocytic leukemia, multiple myeloma, non-Hodgkin's lymphoma, cutaneous T-cell lymphoma, B-cell lymphoma, and hairy cell leukemia, and other cancers;

(e)  $T_H2$ -mediated, atopic diseases, such as atopic dermatitis or eczema, eosinophilia, asthma, allergy, allergic rhinitis, and Ommen's syndrome;

(f) certain autoimmune diseases such as systemic lupus erythematosus, essential thrombocythaemia, multiple sclerosis, discoid lupus, alopecia areata; and

(g) diseases associated with wound repair such as, for example, inhibition of keloid formation and other types of scarring (e.g., enhancing wound healing, including chronic wounds).

Additionally, a compound or salt of the present invention may be useful as a vaccine adjuvant for use in conjunction with any material that raises either humoral and/or cell mediated immune response, such as, for example, live viral, bacterial, or parasitic immunogens; inactivated viral, tumor-derived, protozoal, organism-derived, fungal, or bacterial immunogens; toxoids; toxins; self-antigens; polysaccharides; proteins; glycoproteins; peptides; cellular vaccines; DNA vaccines; autologous vaccines; recombinant proteins; and the like, for use in connection with, for example, BCG, cholera, plague, typhoid, hepatitis A, hepatitis B, hepatitis C, influenza A, influenza B, parainfluenza, polio, rabies, measles, mumps, rubella, yellow fever, tetanus, diphtheria, hemophilus influenza b, tuberculosis, meningococcal and pneumococcal vaccines, adenovirus, HIV, chicken pox, cytomegalovirus, dengue, feline leukemia, fowl plague, HSV-1 and HSV-2, hog cholera, Japanese encephalitis, respiratory syncytial virus, rotavirus, papilloma virus, yellow fever, and Alzheimer's Disease.

Compounds or salts of the present invention may be particularly helpful in individuals having compromised immune function. For example, compounds or salts may be used for treating the opportunistic infections and tumors that occur after suppression of cell mediated immunity in, for example, transplant patients, cancer patients and HIV patients.

Thus, one or more of the above diseases or types of diseases, for example, a viral disease or a neoplastic disease may be treated in an animal in need thereof (having the disease) by administering a therapeutically effective amount of a compound or salt of the invention to the animal.

An amount of a compound or salt effective to induce cytokine biosynthesis is an amount sufficient to cause one or more cell types, such as monocytes, macrophages, dendritic cells and B-cells to produce an amount of one or more cytokines such as, for example, IFN- $\alpha$ , TNF- $\alpha$ , IL-1, IL-6, IL-10 and IL-12 that is increased (induced) over a background level of such cytokines. The precise amount will vary according to factors known in the art but is expected to be a dose of about 100 ng/kg to about 50 mg/kg, preferably about 10  $\mu$ g/kg to about 5 mg/kg. The invention also provides a method of treating a viral infection in an animal and a method of treating a neoplastic disease in an animal comprising administering an effective amount of a compound or salt or composition of the invention to the animal. An amount effective to treat or inhibit a viral infection is an amount that will cause a reduction in one or more of the manifestations of viral infection, such as viral lesions, viral load, rate of virus production, and mortality as compared to untreated control animals. The precise amount that is effective for such treatment will vary according to factors known in the art but is expected to be a dose of about 100 ng/kg to about 50 mg/kg, preferably about 10  $\mu$ g/kg to about 5 mg/kg. An amount of a compound or salt effective to treat a neoplastic condition is an amount that will cause a reduction in tumor size or in the number of tumor foci. Again, the precise amount will vary according to factors known in the art but is expected to be a dose of about 100 ng/kg to about 50 mg/kg, preferably about 10  $\mu$ g/kg to about 5 mg/kg.

In addition to the formulations and uses described specifically herein, other formulations, uses, and administration devices suitable for compounds of the present invention are described in, for example, International Publication Nos. WO 03/077944 and

WO 02/036592, U.S. Patent No. 6,245,776, and U.S. Publication Nos. 2003/0139364, 2003/185835, 2004/0258698, 2004/0265351, 2004/076633, and 2005/0009858.

## EXAMPLES

Objects and advantages of this invention are further illustrated by the following examples, but the particular materials and amounts thereof recited in these examples, as well as other conditions and details, should not be construed to unduly limit this invention.

10

## Example 1

1-{[4-Amino-2-(ethoxymethyl)-1*H*-imidazo[4,5-*c*]quinolin-1-yl]methyl}cyclohexanol

## Part A

To a mixture of 4-chloro-3-nitroquinoline (6.30 g, 30.2 mmol) in dichloromethane (100 mL) at 0 °C was added triethylamine (0.1 mL). To the resulting solution was added 1-aminomethyl-1-cyclohexanol hydrochloride (5.00 g, 30.2 mmol), then triethylamine (4.1 mL) and tetrahydrofuran (THF, 20 mL). The mixture was allowed to warm to room temperature (rt) and more triethylamine (4.2 mL) was added. The yellow mixture was stirred overnight, then was concentrated to about half the volume and heated at reflux for 1 hour (h). The mixture was concentrated and the solid was partitioned between 1 M aqueous NaOH (100 mL) and CH<sub>2</sub>Cl<sub>2</sub> (200 mL). The organic layer was washed with water (2 x 50 mL) and brine (50 mL), dried over MgSO<sub>4</sub>, filtered, and concentrated to a yellow solid that was crystallized from hot isopropanol to yield yellow crystals (9.04 g). <sup>1</sup>H NMR analysis of the yellow crystals showed a 1:1.4 mixture of isopropyl alcohol to 1-  
25 {[(3-nitroquinolin-4-yl)amino]methyl}cyclohexanol. Based on the <sup>1</sup>H NMR result, the mass of the 1-{[(3-nitroquinolin-4-yl)amino]methyl}cyclohexanol in the mixture was calculated (7.88 g, 87%). The product was used without further purification in the next step.

## Part B

A mixture of the 1-{{(3-nitroquinolin-4-yl)amino)methyl}cyclohexanol prepared above (87%, 7.00 g, 20.3 mmol) and 5% platinum on carbon (0.60 g) in toluene (160 mL) and ethanol (20 mL) was hydrogenated at 20-30 psi ( $1.4 \times 10^5$  to  $2.1 \times 10^5$  Pa) on a Parr apparatus for 2 h. The mixture was filtered through CELITE filter agent, which was rinsed with toluene. The filtrate was concentrated to a golden oil. The oil was concentrated twice from toluene. To the oil was added  $\text{CH}_2\text{Cl}_2$  (200 mL) and the resulting solution was cooled in an ice bath. Triethylamine (3.11 mL, 22.3 mmol) was added followed by dropwise addition of ethoxyacetyl chloride (88%, 2.96 g, 21.3 mmol). The solution was allowed to warm to rt and stir for 1 h, during which time a precipitate formed. The reaction mixture was concentrated to a yellow foam to which ethanol (200 mL) and triethylamine (11 mL) were added. The resulting solution was heated at reflux for 13 h. The solution was concentrated to a yellow solid, which was dissolved in  $\text{CH}_2\text{Cl}_2$  (150 mL) and washed with water (50 mL) and brine (75 mL). The organic layer was dried over  $\text{MgSO}_4$ , filtered, and concentrated to a solid that was crystallized from  $\text{CDCl}_3/\text{CH}_2\text{Cl}_2$  to yield 1-{{2-(ethoxymethyl)-1*H*-imidazo[4,5-*c*]quinolin-1-yl)methyl}cyclohexanol as pale orange crystals after drying (1.94 g, 28%).

## Part C

To a solution of 1-{{2-(ethoxymethyl)-1*H*-imidazo[4,5-*c*]quinolin-1-yl)methyl}cyclohexanol (1.90 g, 5.60 mmol) in  $\text{CHCl}_3$  (43 mL) was added *m*-chloroperoxybenzoic acid (*m*-CPBA, 77% w/w, 1.26 g, 5.60 mmol) over 15 min. The reaction was monitored by thin layer chromatography (TLC) and more *m*-CPBA was added over 1 h until the starting material was consumed. Water (40 mL) and solid  $\text{K}_2\text{CO}_3$  were added to the reaction mixture until the pH = 10. The mixture was poured into a separatory funnel and extracted with chloroform, resulting in an emulsion. The aqueous layer was extracted with chloroform three times. The combined organic layers were washed with water and brine, dried over  $\text{MgSO}_4$ , filtered, and concentrated to yield a crude white solid (1.51 g). The white solid (1.51 g, 4.24 mmol) was dissolved in dichloromethane (25 mL) at rt and concentrated ammonium hydroxide (16 mL) was added, followed by *p*-toluenesulfonyl chloride ( $\text{TsCl}$ , 0.81 g, 4.24 mmol). The mixture was stirred 1 day (d). Water (25 mL) was added and the aqueous layer was extracted with dichloromethane (2 x 30 mL). The combined organic layers were washed with brine (25

The mixture was stirred for 5 min and a solution formed from which a solid precipitated. After 1.5 h, water (100 mL) was added and the solid was isolated by filtration, washed with water (100 mL), and dried under vacuum with heat to yield the product ethyl 4-hydroxy-4-(nitromethyl)piperidine-1-carboxylate as an off white solid, 9.58 g (62%).

#### Part B

A mixture of ethyl 4-hydroxy-4-(nitromethyl)piperidine-1-carboxylate (5.2 g, 22.4 mmol) and 20% palladium hydroxide on carbon (0.50 g) in ethanol (190 mL) was hydrogenated at 35 psi ( $2.4 \times 10^5$  Pa) on a Parr apparatus for 5 h. The mixture was filtered

through CELITE filter agent and the filtrate was concentrated. By  $^1\text{H}$  NMR analysis, the reaction was incomplete and the crude material was subjected to the reaction conditions again with fresh 20% palladium hydroxide on carbon (0.50 g) for another 24 h. The mixture was filtered through CELITE filter agent and the filtrate was concentrated to provide ethyl 4-(aminomethyl)-4-hydroxypiperidine-1-carboxylate, which was concentrated from chloroform to remove residual ethanol before using in the next reaction.

#### Part A

To a solution of cyclobutanone (10.0 g, 143 mmol) and nitromethane (12 mL) in ethanol (10 mL) was added sodium ethoxide in ethanol (2.67 M, 2.7 mL, 7.2 mmol). The mixture was stirred for 6 d at rt. Water was added and the mixture was extracted thrice with ethyl acetate. The organic phases were combined, washed with water and brine, dried over Na<sub>2</sub>SO<sub>4</sub>, filtered, and concentrated. The volatiles were removed by distillation under vacuum to provide 1-(nitromethyl)cyclobutanol as a yellow liquid (8.51 g, 45%).

#### Part B

A mixture of 1-(nitromethyl)cyclobutanol (8.2 g, 62.5 mmol) and 20% palladium hydroxide on carbon (1.0 g) in ethanol (200 mL) was hydrogenated at 40 psi (2.8 x 10<sup>5</sup> Pa) on a Parr apparatus for 6 d. More 20% palladium hydroxide on carbon (1.2 g) was added and the mixture was hydrogenated at 40 psi (2.8 x 10<sup>5</sup> Pa) for an additional 5 d. The

mixture was filtered through CELITE filter agent, which was rinsed with ethanol. The filtrate was concentrated to an oil that was concentrated from dichloromethane and chloroform to remove residual ethanol. 1-(Aminomethyl)cyclobutanol was obtained as an off white solid (6.15 g) that was used without further purification in the next step.

5 Part C

To a solution of 1-(aminomethyl)cyclobutanol (62.5 mmol) in dichloromethane (312 mL) was added triethylamine (8.71 mL, 62.5 mmol) and 4-chloro-3-nitroquinoline (13.04 g, 62.5 mmol). More triethylamine (3 mL) was added almost immediately. The reaction was stirred under N<sub>2</sub> for 10 d at rt, then was diluted with dichloromethane and washed with 1 M aqueous NaOH. A solid formed and was isolated by filtration. The organic layer was washed with water and brine, dried over Na<sub>2</sub>SO<sub>4</sub>, filtered, and concentrated to a solid that was crystallized from isopropanol. The resulting crystals were combined with the solid that was isolated from the extraction and the mixture was triturated with hot isopropanol. ### CYTOKINE INDUCTION IN HUMAN CELLS

5           An in vitro human blood cell system is used to assess cytokine induction. Activity is based on the measurement of interferon ( $\alpha$ ) and tumor necrosis factor ( $\alpha$ ) (IFN- $\alpha$  and TNF- $\alpha$ , respectively) secreted into culture media as described by Testerman et. al. in "Cytokine Induction by the Immunomodulators Imiquimod and S-27609", *Journal of Leukocyte Biology*, 58, 365-372 (September, 1995).

#### 10           Blood Cell Preparation for Culture

Whole blood from healthy human donors is collected by venipuncture into vacutainer tubes or syringes containing EDTA. Peripheral blood mononuclear cells (PBMC) are separated from whole blood by density gradient centrifugation using  
15       HISTOPAQUE-1077 (Sigma, St. Louis, MO) or Ficoll-Paque Plus (Amersham Biosciences Piscataway, NJ). Blood is diluted 1:1 with Dulbecco's Phosphate Buffered Saline (DPBS) or Hank's Balanced Salts Solution (HBSS). Alternately, whole blood is placed in Accuspin (Sigma) or LeucoSep (Greiner Bio-One, Inc., Longwood, FL) centrifuge frit tubes containing density gradient medium. The PBMC layer is collected  
20       and washed twice with DPBS or HBSS and re-suspended at  $4 \times 10^6$  cells/mL in RPMI complete. The PBMC suspension is added to 96 well flat bottom sterile tissue culture plates containing an equal volume of RPMI complete media containing test compound.

#### Compound Preparation

25           The compounds are solubilized in dimethyl sulfoxide (DMSO). The DMSO concentration should not exceed a final concentration of 1 % for addition to the culture wells. The compounds are generally tested at concentrations ranging from 30-0.014  $\mu$ M. Controls include cell samples with media only, cell samples with DMSO only (no compound), and cell samples with reference compound.

## Incubation

The solution of test compound is added at 60  $\mu$ M to the first well containing RPMI complete and serial 3 fold dilutions are made in the wells. The PBMC suspension is then added to the wells in an equal volume, bringing the test compound concentrations to the  
5 desired range (usually 30-0.014  $\mu$ M). The final concentration of PBMC suspension is  $2 \times 10^6$  cells/mL. The plates are covered with sterile plastic lids, mixed gently and then incubated for 18 to 24 hours at 37 °C in a 5% carbon dioxide atmosphere.

## Separation

10 Following incubation the plates are centrifuged for 10 minutes at 1000 rpm (approximately 200 x g) at 4 °C. The cell-free culture supernatant is removed and transferred to sterile polypropylene tubes. Samples are maintained at -30 to -70 °C until analysis. The samples are analyzed for IFN- $\alpha$  by ELISA and for TNF- $\alpha$  by IGEN/BioVeris Assay.

## Interferon ( $\alpha$ ) and Tumor Necrosis Factor ( $\alpha$ ) Analysis

IFN- $\alpha$  concentration is determined with a human multi-subtype colorimetric sandwich ELISA (Catalog Number 41105) from PBL Biomedical Laboratories, Piscataway, NJ. Results are expressed in pg/mL.

20 The TNF- $\alpha$  concentration is determined by ORIGEN M-Series Immunoassay and read on an IGEN M-8 analyzer from BioVeris Corporation, formerly known as IGEN International, Gaithersburg, MD. The immunoassay uses a human TNF- $\alpha$  capture and detection antibody pair (Catalog Numbers AHC3419 and AHC3712) from Biosource International, Camarillo, CA. Results are expressed in pg/mL.

## Assay Data and Analysis

In total, the data output of the assay consists of concentration values of TNF- $\alpha$  and IFN- $\alpha$  (y-axis) as a function of compound concentration (x-axis).

30 Analysis of the data has two steps. First, the greater of the mean DMSO (DMSO control wells) or the experimental background (usually 20 pg/mL for IFN- $\alpha$  and 40 pg/mL for TNF- $\alpha$ ) is subtracted from each reading. If any negative values result from background subtraction, the reading is reported as " \* ", and is noted as not reliably

detectable. In subsequent calculations and statistics, " \* ", is treated as a zero. Second, all background subtracted values are multiplied by a single adjustment ratio to decrease experiment to experiment variability. The adjustment ratio is the area of the reference compound in the new experiment divided by the expected area of the reference compound based on the past 61 experiments (unadjusted readings). This results in the scaling of the reading (y-axis) for the new data without changing the shape of the dose-response curve. The reference compound used is 2-[4-amino-2-ethoxymethyl-6,7,8,9-tetrahydro- $\alpha,\alpha$ -dimethyl-1*H*-imidazo[4,5-*c*]quinolin-1-yl]ethanol hydrate (U.S. Patent No. 5,352,784; Example 91) and the expected area is the sum of the median dose values from the past 61 experiments.

The minimum effective concentration is calculated based on the background-subtracted, reference-adjusted results for a given experiment and compound. The minimum effective concentration ( $\mu$ molar) is the lowest of the tested compound concentrations that induces a response over a fixed cytokine concentration for the tested cytokine (usually 20 pg/mL for IFN- $\alpha$  and 40 pg/mL for TNF- $\alpha$ ). The maximal response is the maximal amount of cytokine (pg/ml) produced in the dose-response.

## CYTOKINE INDUCTION IN HUMAN CELLS

### (High Throughput Screen)

The CYTOKINE INDUCTION IN HUMAN CELLS test method described above was modified as follows for high throughput screening.

#### Blood Cell Preparation for Culture

Whole blood from healthy human donors is collected by venipuncture into vacutainer tubes or syringes containing EDTA. Peripheral blood mononuclear cells (PBMC) are separated from whole blood by density gradient centrifugation using HISTOPAQUE-1077 (Sigma, St. Louis, MO) or Ficoll-Paque Plus (Amersham Biosciences Piscataway, NJ). Whole blood is placed in Accuspin (Sigma) or LeucoSep (Greiner Bio-One, Inc., Longwood, FL) centrifuge frit tubes containing density gradient medium. The PBMC layer is collected and washed twice with DPBS or HBSS and re-suspended at  $4 \times 10^6$  cells/mL in RPMI complete (2-fold the final cell density). The PBMC suspension is added to 96-well flat bottom sterile tissue culture plates.

### Compound Preparation

The compounds are solubilized in dimethyl sulfoxide (DMSO). The compounds are generally tested at concentrations ranging from 30 - 0.014  $\mu$ M. Controls include cell samples with media only, cell samples with DMSO only (no compound), and cell samples with a reference compound 2-[4-amino-2-ethoxymethyl-6,7,8,9-tetrahydro- $\alpha,\alpha$ -dimethyl-1H-imidazo[4,5-c]quinolin-1-yl]ethanol hydrate (U.S. Patent No. 5,352,784; Example 91) on each plate. The solution of test compound is added at 7.5 mM to the first well of a dosing plate and serial 3 fold dilutions are made for the 7 subsequent concentrations in DMSO. RPMI Complete media is then added to the test compound dilutions in order to reach a final compound concentration of 2-fold higher (60 - 0.028  $\mu$ M) than the final tested concentration range.

### Incubation

Compound solution is then added to the wells containing the PBMC suspension bringing the test compound concentrations to the desired range (usually 30 - 0.014  $\mu$ M) and the DMSO concentration to 0.4 %. The final concentration of PBMC suspension is  $2 \times 10^6$  cells/mL. The plates are covered with sterile plastic lids, mixed gently and then incubated for 18 to 24 hours at 37 °C in a 5 % carbon dioxide atmosphere.

### Separation

Following incubation the plates are centrifuged for 10 minutes at 1000 rpm (approximately 200 g) at 4 °C. 4-plex Human Panel MSD MULTI-SPOT 96-well plates are pre-coated with the appropriate capture antibodies by MesoScale Discovery, Inc. (MSD, Gaithersburg, MD). The cell-free culture supernatants are removed and transferred to the MSD plates. Fresh samples are typically tested, although they may be maintained at -30 to -70 °C until analysis.

### Interferon- $\alpha$ and Tumor Necrosis Factor- $\alpha$ Analysis

MSD MULTI-SPOT plates contain within each well capture antibodies for human TNF- $\alpha$  and human IFN- $\alpha$  that have been pre-coated on specific spots. Each well contains four spots: one human TNF- $\alpha$  capture antibody (MSD) spot, one human IFN- $\alpha$  capture

antibody (PBL Biomedical Laboratories, Piscataway, NJ) spot, and two inactive bovine serum albumin spots. The human TNF- $\alpha$  capture and detection antibody pair is from MesoScale Discovery. The human IFN- $\alpha$  multi-subtype antibody (PBL Biomedical Laboratories) captures all IFN- $\alpha$  subtypes except IFN- $\alpha$  F (IFNA21). Standards consist of recombinant human TNF- $\alpha$  (R&D Systems, Minneapolis, MN) and IFN- $\alpha$  (PBL Biomedical Laboratories). Samples and separate standards are added at the time of analysis to each MSD plate. Two human IFN- $\alpha$  detection antibodies (Cat. Nos. 21112 & 21100, PBL) are used in a two to one ratio (weight:weight) to each other to determine the IFN- $\alpha$  concentrations. The cytokine-specific detection antibodies are labeled with the SULFO-TAG reagent (MSD). After adding the SULFO-TAG labeled detection antibodies to the wells, each well's electrochemoluminescent levels are read using MSD's Sector HTS READER. Results are expressed in pg/mL upon calculation with known cytokine standards.

#### Assay Data and Analysis

In total, the data output of the assay consists of concentration values of TNF- $\alpha$  or IFN- $\alpha$  (y-axis) as a function of compound concentration (x-axis).

A plate-wise scaling is performed within a given experiment aimed at reducing plate-to-plate variability associated within the same experiment. First, the greater of the median DMSO (DMSO control wells) or the experimental background (usually 20 pg/mL for IFN- $\alpha$  and 40 pg/mL for TNF- $\alpha$ ) is subtracted from each reading. Negative values that may result from background subtraction are set to zero. Each plate within a given experiment has a reference compound that serves as a control. This control is used to calculate a median expected area under the curve across all plates in the assay. A plate-wise scaling factor is calculated for each plate as a ratio of the area of the reference compound on the particular plate to the median expected area for the entire experiment. The data from each plate are then multiplied by the plate-wise scaling factor for all plates. Only data from plates bearing a scaling factor of between 0.5 and 2.0 (for both cytokines IFN- $\alpha$ , TNF- $\alpha$ ) are reported. Data from plates with scaling factors outside the above mentioned interval are retested until they bear scaling factors inside the above mentioned interval. The above method produces a scaling of the y-values without altering the shape of the curve. The reference compound used is 2-[4-amino-2-ethoxymethyl-6,7,8,9-

tetrahydro- $\alpha,\alpha$ -dimethyl-1*H*-imidazo[4,5-*c*]quinolin-1-yl]ethanol hydrate (U.S. Patent No. 5,352,784; Example 91). The median expected area is the median area across all plates that are part of a given experiment.

A second scaling may also be performed to reduce inter-experiment variability (across multiple experiments). All background-subtracted values are multiplied by a single adjustment ratio to decrease experiment-to-experiment variability. The adjustment ratio is the area of the reference compound in the new experiment divided by the expected area of the reference compound based on an average of previous experiments (unadjusted readings). This results in the scaling of the reading (y-axis) for the new data without changing the shape of the dose-response curve. The reference compound used is 2-[4-amino-2-ethoxymethyl-6,7,8,9-tetrahydro- $\alpha,\alpha$ -dimethyl-1*H*-imidazo[4,5-*c*]quinolin-1-yl]ethanol hydrate (U.S. Patent No. 5,352,784; Example 91) and the expected area is the sum of the median dose values from an average of previous experiments.

The minimum effective concentration is calculated based on the background-subtracted, reference-adjusted results for a given experiment and compound. The minimum effective concentration ( $\mu$ molar) is the lowest of the tested compound concentrations that induces a response over a fixed cytokine concentration for the tested cytokine (usually 20 pg/mL for IFN- $\alpha$  and 40 pg/mL for TNF- $\alpha$ ). The maximal response is the maximal amount of cytokine (pg/ml) produced in the dose-response.
